Porcelain Material

# Luxaface<sup>®</sup>

## Porcelain Material

Luxaface Porcelain Material is another type of quality worktop underwnt a rigorous selection process to ensure that our customer gets the best quality material.

### Characteristics of Porcelain:

1. **Abrasion resistant**

Porcelain stoneware is resistant to abrasion or wear due to contact.

2. **Waterproof**

A vitrified structure with a low degree of porosity guarantees a very low water absorption rate.

3. **Easy to clean**

The slightly porous structure makes it a clean material, which does not stain easily because it does not absorb dirt. Its compact surface also makes it easy to clean.

4. **Fire resistant**

Stoneware is insensitive to sudden changes in temperature. It is therefore suitable for indoors, on surfaces that can come into contact with hot objects/

5. **Unalterable over time**

Its exceptional resistance to abrasion, fire and impermeability make porcelain stoneware an almost unalterable material over time. Feature that makes it a high-value investment.

6. **Ecological**

The materials are natural and, given its characteristics, it does not require chemical waterproofing, paints or resins that would make it harmful. It does not release radon or other toxic gases, even when in contact with heat sources.
